CC sensor:	Cold cathode sensor
HV:	High vacuum sensor

Product description

Function

The DeviceNet connector (M12, A-coded) is used to connect to a DeviceNet system. The connector is also used to apply the supply voltage (in the model with relay contacts exclusively via this connector).

Variants

- DeviceNet standard version (1a+3):
 - Power supply possible via 1a or 3.
- Version RS-485/8pol. with relay contacts (1b+3):
 - Power supply exclusively possible via 3.

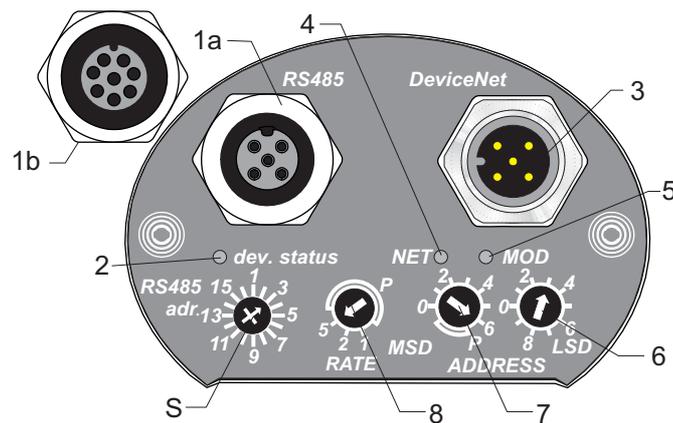

Fig. 1: Connections

1a	RS-485 Interface, 5-pole	4	DeviceNet status LED	7	DN address selector switch (MSD)
1b	RS-485 Interface and relay contacts, 8-pole	5	Module status LED	8	Switch DN baudrate
2	Gauge status LED	6	DN address selector switch (LSD)	S	RS-485 address selector switch
3	DeviceNet interface				

Installation

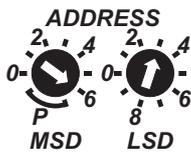

Configuring the connection

To start DeviceNet communication, the unit can be configured using the appropriate EDS files.

- Select desired device address
- Select desired baud rate
- Fit rubber plugs at the address selector switches evenly and as deep as possible to achieve the stated protection class.

Device address

The DeviceNet device address is set manually using the "**ADDRESS**" selector switches or via DeviceNet.

Position	Meaning
00 to 63	Device address (decimal) – MSD = multiples of 10 (0x-6x) – LSD = units (x0-x9)
P	Address via DeviceNet

Setting the address manually

- Set the selector switches to the desired value.
 - Once the setting has been made, the device accesses the bus using the new address.

Setting the address via DeviceNet

- Switch off the unit or disconnect it from the mains supply.
- Set the selector switches to "P".
 - When switched on, the system uses the last valid address ("63" upon delivery).
 - The address is programmable via DeviceNet object 3.1.1. (see p. 9, chap.).

Baud rate

The DeviceNet baud rate is set manually using the "RATE" selector switches or via DeviceNet.

Position	Meaning
1	125 kBit/s
2	250 kBit/s
5	500 kBit/s
P	Baud rate via DeviceNet

Setting the baud rate manually

- Set the selector switches to the desired value.
 - The change takes effect the next time the system is switched on.

Setting the baud rate via DeviceNet

- Switch off the unit or disconnect it from the mains supply.
- Set the selector switches to "P".
 - When switched on, the system uses the last valid baud rate (500 kBit/s upon delivery).
 - The baud rate is programmable via DeviceNet object 3.1.2. (see p. 12, chap.).

Connection "DeviceNet"

Power is supplied to the gauge via the RS-485 connector (see operating instruction of the standard version) or via DeviceNet connector. For the version with relay contacts exclusively via DeviceNet.

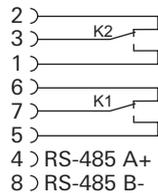

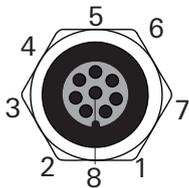

NOTICE	
Damage to the product	
Only connect cables when de-energized.	
→ Never establish a connection using a live cable.	

Standard version

Pin	Assignment
1	Drain
2	V+, 24 V DC referred to V-
3	V-
4	CAN_H
5	CAN_L

8-pole version/relay contacts

→ Perform DeviceNet wiring in accordance with the applicable specifications.

Adjusting address and baud rate

Manual address set up

→ Set up the DeviceNet address (00-63) through the switches marked *ADDRESS*. The switch position marked *MSD* designates the tens decimals, *LSD* denotes the ones decimals.

Address set up through DeviceNet

→ In the switched off state, set the switch *ADDRESS MSD* to *P*.
 – After switching the instrument on, it will resume operation with the last valid address which was entered (factory default 63), which may be set up through the object DeviceNet / instance 1 / MAC ID (3.1.1)

Manual baud rate set up

→ The DeviceNet baud rate is set up in the switched off state through the switch marked *RATE*.

Baud rate set up through DeviceNet

→ In the switched off state, set the switch *RATE* to *P*.
 – After switching the instrument on, it will operate using the last valid baud rate (factory default 500 k), which may be set up through the object DeviceNet / instance 1 / baud rate (3.1.2). Changes will only come into effect after having reset the instrument (supply voltage OFF/ON).

Operation

- Before placing the unit into operation, set the unique and valid DeviceNet address and baud rate using the selection switches.

General

- In order to establish a connection apply the service "allocate master/slave connection set" to the instance of the DeviceNet object,
 - for this state the desired connection (Explicit / Poll I/O) and set the attribute "expected packet rate" for the respective connection.

Status LED

Status gauge LED

See operating instructions of the standard version of the respective gauge.

LED operation

NET

LED Status	Meaning	Action
Off	Device not on bus	⇒ Supply operating voltage ⇒ Wait for address test (approx. 2 s)
Green flashing	On bus, no master allocated	⇒ Create connection with master
Green on	On bus, master allocated	
Red flashing	Connection to master expired	⇒ Test connection to master
Red on	Bus error or duplicate device address allocated	⇒ Check bus ⇒ Check device address ⇒ Check baud rate

MOD

LED Status	Meaning	Action
Off	No voltage supply	⇒ Supply operating voltage
Green on	Device ready for operation	
Red flashing	Device error	⇒ Resolve error

Configuration

For the configuration of the DeviceNet EDS files provided on www.pfeiffer-vacuum.de can be used. Depending on the configuration tool it might be reasonable to use an individual EDS file for the respective data type of the pressure value (please see data type).

Data type of pressure value

INT data type: 2 Byte integer, value between 0 and 65535 (default), use EDS file "default (INT pressure value)*.eds".

REAL data type: 4 Byte floating point, use EDS file "default (INT pressure value)*.eds" or if applicable EDS file "REAL pressure value*REAL.eds".

- Set data type to INT (default): C3h or REAL: CAh via explicite connection to "S-Analog Sensor"/instance 1/data type (49.1.3) or with configuration tool.
- The choice of the data type affects the I/O data (please see "Reading the actual pressure value").

Physical unit of pressure value

Set data type to one of the following units via explicite connection to "S-Analog Sensor"/instance 1/data units (49.1.4) or with configuration tool.

- Counts (=mbar, default): 1001h
- Psi: 1300h
- Torr: 1301h
- mTorr: 1302h
- mbar: 1308h
- Pa: 1309h

Data type and physical unit can be only adjusted, as long as no poll I/O-connection is active.

Trip point and hysteresis

- Set the trip point via explicite connection:
 - "Trip point"/instance 1 or instance 2/attribute 5
 - Default value after start up: 0
- Set the hysteresis via explicite connection:
 - "Trip point"/instance 1 or instance 2/attribute 10
 - Default value after start up: 0
- Use data type and data unit for trip point and hysteresis value:
 - "S-Analog Sensor"/instance 1/data type (49.1.3)
 - "S-Analog Sensor"/ instance 1/data unit (49.1.4)

DeviceNet objects

The functions of the transmitter can be accessed through the TIC through the following DeviceNet objects based on the profile "Vacuum/Pressure Gauge Device":

class	inst.	comment
1: Identity	1	Unit attribute
2: Message router	1	-
3: DeviceNet	1	Communication setup
4: Assembly	2	input 1 Status byte + actual pressure value INT (2 Byte integer 0 ... 65535)
	5	input 1 Status byte + actual pressure value REAL (4 Byte floating point)
5: Connection	1	Explicit (single access to functions)
	2	Poll I/O (typically exchange of an assembly object)
48: S-Device Supervisor	1	Device and status information
49: S analog sensor	1	Actual pressure value
	2	Actual pressure value (only RPT 200, HPT 200 und MPT 200)
53: Trip point	1	Trip point 1
	2	Trip point 2

Table 1: For the individual functions see "DeviceNet Statement of Conformance"; the more important functions are described here in greater detail.

Reading actual pressure value

- Set up data type and physical unit.
- Read unit attribute "s-analog sensor"/instance 1/value (49.1.6) via the "explicit connection" *and/or*
- read input data via the poll I/O connection. Input data contains 3 Byte (1 status byte + INT actual pressure value) or 5 Byte (1 status Byte + REAL actual pressure value).

Pressure adjustment

- Follow procedure according to the gauge currently used.
- Zero: apply the service "Zero_Adjust" to the corresponding instance of the "s-analog sensor" object using the explicit connection.
- Atmosphere: apply the service "Gain_Adjust" to the corresponding instance of the "s-analog sensor" object using the explicit connection.

DeGas (only for HPT 200)

- Follow procedure according to the gauge currently used.
- Apply the service "Set_DeGas_State" via the explicit connection to the instance 2 of the "S-Analog Sensor" object with data 0 (off) or 1 (on).

Correction factors (not valid for CPT 200)

- Use valid values for the sensor of the currently used gauge and follow the appropriate procedure.
- Set the gain attribute of the corresponding instance of the "s-analog Sensor" objects via the explicit connection.

DeviceNet Statement of Conformance

General Device Data	
Conform to DeviceNet Specification	Volume I, Release 2.0, Volume II, Release 2.0
Vendor Name	Pfeiffer Vacuum
Device Profile Name	Vacuum/Pressure Gauge Device
Product Catalog Number	-
Product Revision	1.1
DeviceNet Physical Conformance Data	
Network Power Consumption (Max)	0.1 A + power consumption of connected gauge @ 11 V DC (worst case)
Connector Style	Sealed-Micro
Isolated Physical Layer	No
LEDs supported	Module, Network
MAC ID Setting	BCD-Switch, Network Selectable
Default MAC ID	63
Communication Rate Setting	BCD-Switch, Network Selectable
Communication Rates Supported	125 k, 250 k, 500 k
DeviceNet Communication Data	
Predefined Master/Slave Connection Set	Group 2 Only Server
Fragmented Explicit Messaging Implemented	Yes
Transmission Time Out	1000 ms
Typical Target Address Class, Instance, Attribute	1, 1, 7

VACUUM SOLUTIONS FROM A SINGLE SOURCE

Pfeiffer Vacuum stands for innovative and custom vacuum solutions worldwide, technological perfection, competent advice and reliable service.

COMPLETE RANGE OF PRODUCTS

From a single component to complex systems:

We are the only supplier of vacuum technology that provides a complete product portfolio.

COMPETENCE IN THEORY AND PRACTICE

Benefit from our know-how and our portfolio of training opportunities!

We support you with your plant layout and provide first-class on-site service worldwide.

Are you looking for a
perfect vacuum solution?
